

Monease

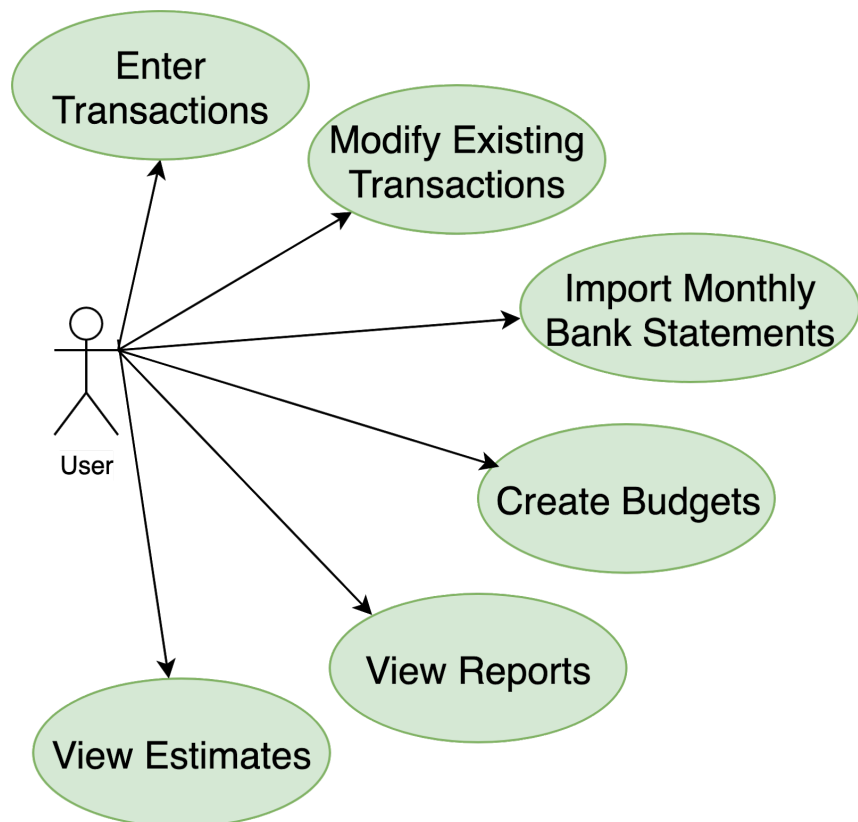

Architectural Perspectives

Megan Brust, Matthew Knobloch, Amaechi Jude Odafi, Steven Toub

Problem Statements

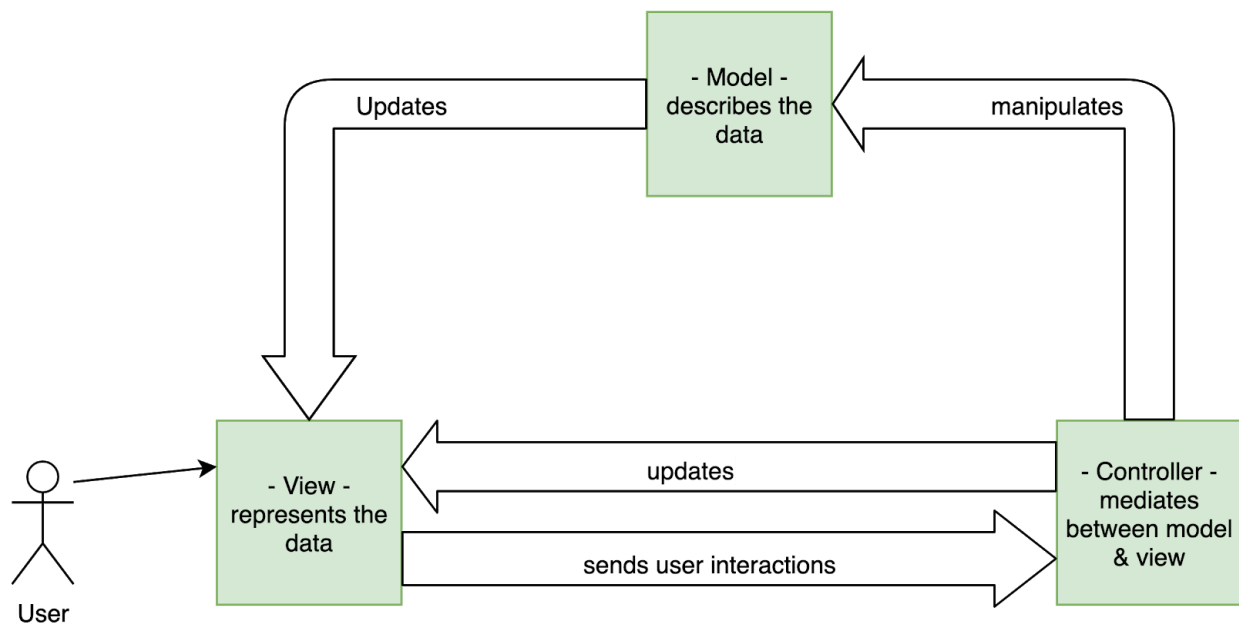

Keeping track of your income and expenses can be time-consuming and overwhelming. This is especially true when you have multiple incomes, bank accounts, and credit cards that are not linked in any way. We propose a simple yet powerful tool that records and analyzes your financial information from various sources in order to assist you in making informed financial decisions for the future.

At the heart
of Monease
are our users.
Users are
individuals
who use
Monease to
track their
finances.

	Feature Name	Description
A user can...	Enter Transactions	As a user, I would like to enter my transactions and relevant information for my day-to-day spending.
	Modify Transactions	As a user, I would like to modify my previous transactions if the information is inaccurate.
	Import Monthly Bank Statements	As a user, I would like to import my monthly bank statements already provided to me by my financial institution.
	Create Budgets	As a user, I would like to create budgets for different areas of my life and classify my transactions accordingly.
	View Reports	As a user, I would like to be able to visualize my spending habits over time through graphical representations.
	View Estimates	As a user, I would like to view estimates of how my current spending habits may impact my future spending.

Model View Controller (MVC)

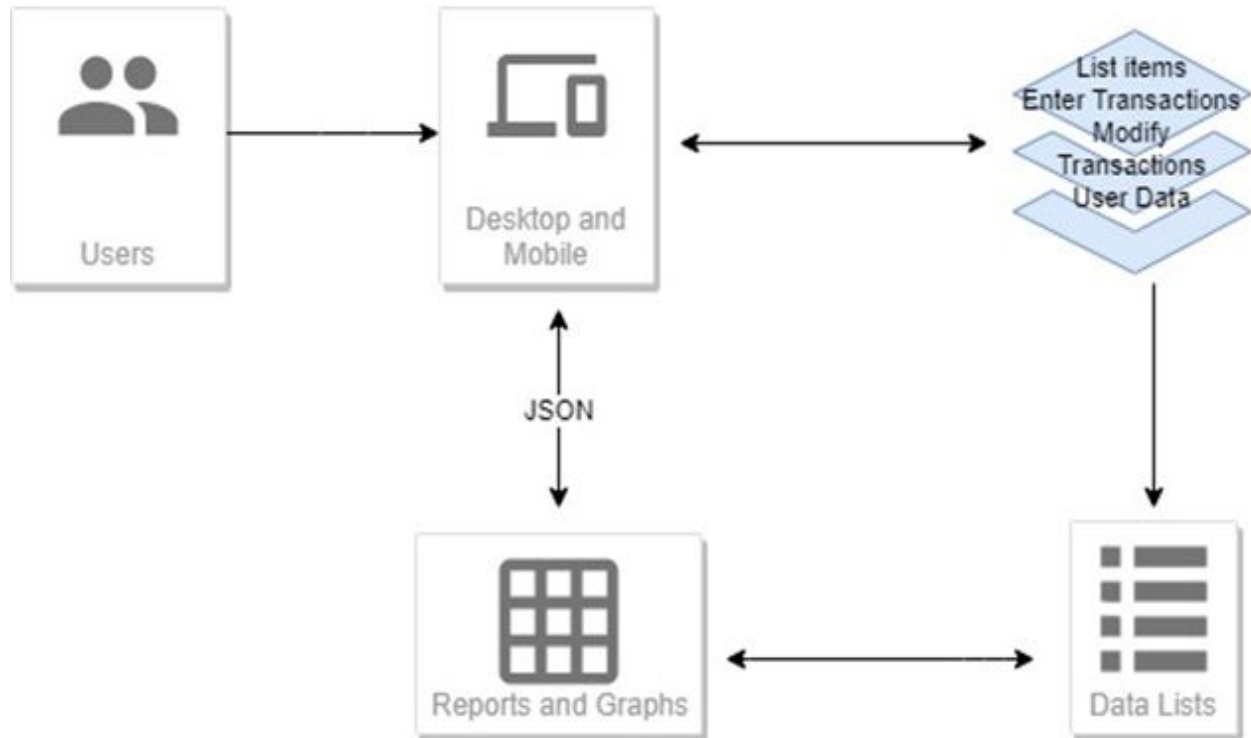

Rationale

We anticipate that as our project grows, users and other stakeholders will want a variety of different views of the user's data in order to facilitate adding different ways to analyze their finances. Our initial view options will include a variety of chart styles, but this architectural decision will allow us to easily expand to incorporate other preferences or requirements, such as different screen sizes and layouts (e.g. tablets, smartphones, etc).

Potential Future Architecture

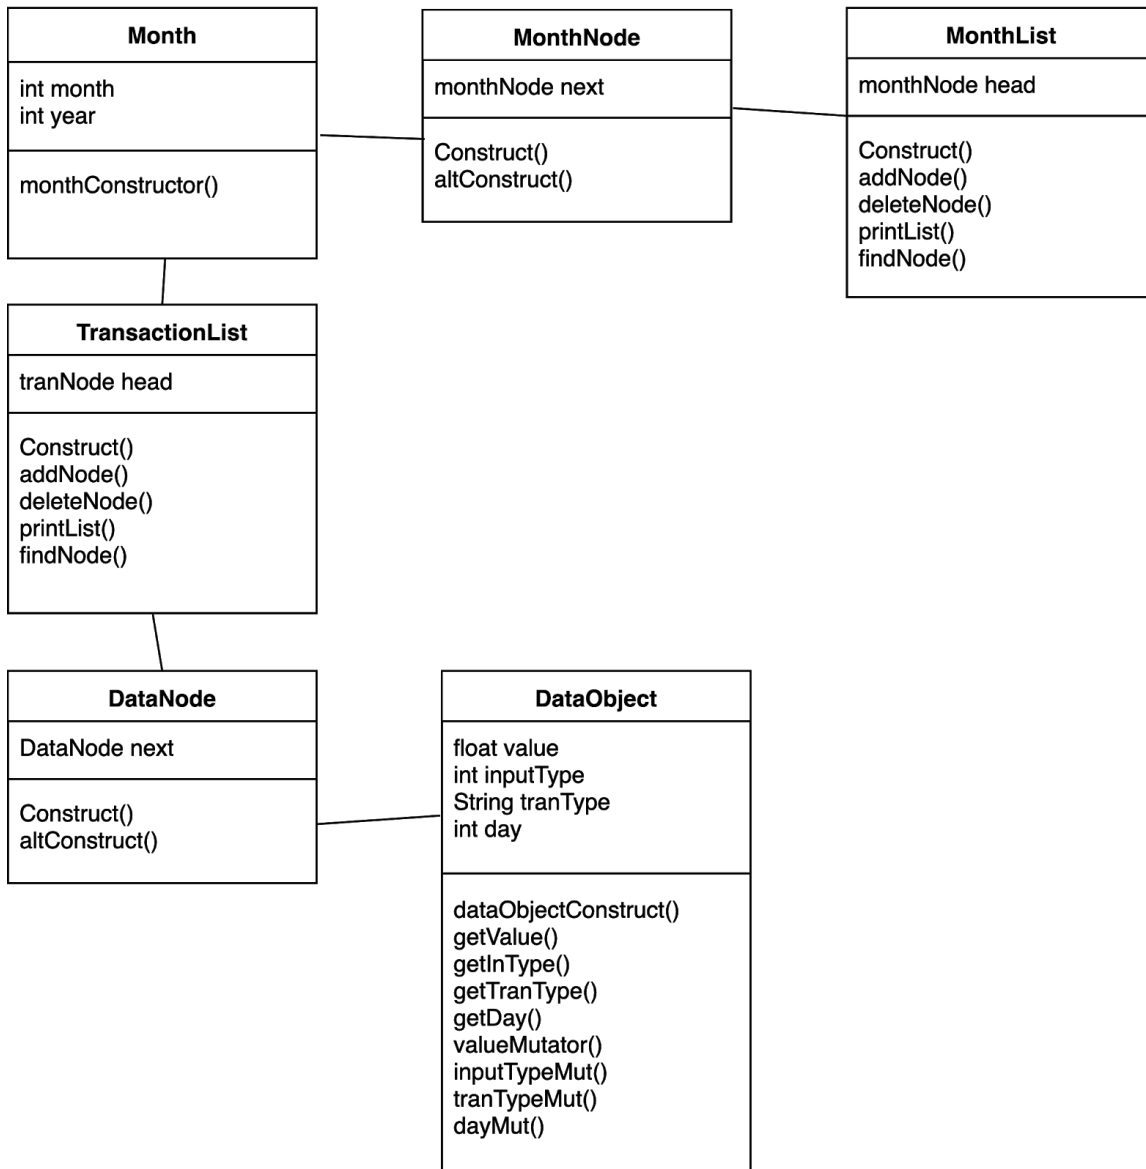

Architecture : Monease Finance

Rationale

We recognize that we live in an era of software that caters to a wide variety of platforms. As a group, we discussed whether or not architecting for mobile and other platforms was essential to the task at hand. Recognizing time and personal constraints, we decided that building a minimum viable product for Monease with consideration of multiple platforms was outside of the realm of possibility. However, for future discussions and as documentation, we decided to include this architecture for consideration and potential implementation at a later date. This architecture would allow for remote access to reports and information on the system.

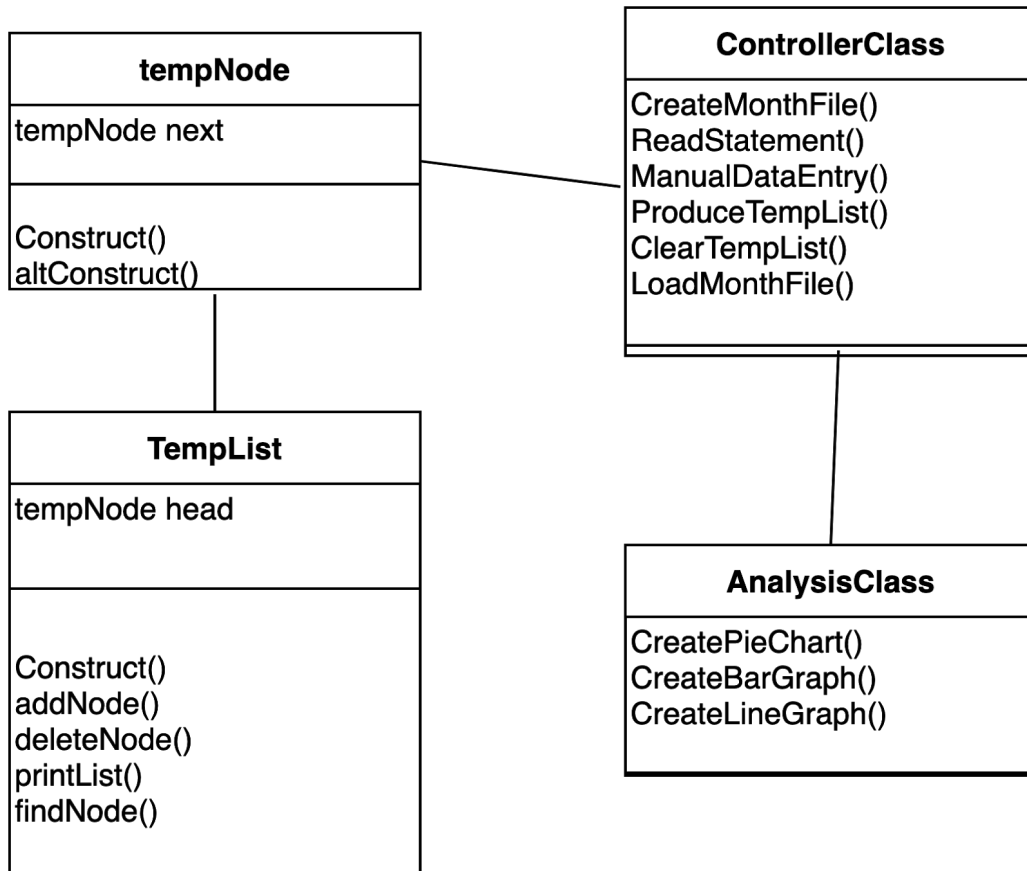

UML of Model

Rationale

Users tend to view their transactions and budget on a monthly basis, therefore we based our data model with a month being the overarching idea. A month list will consist of a linked list of months, which will be a linked list of different data objects representing individual transactions. This is like a layered architecture, only the layers are representing a much smaller scale design than the traditional layered architecture. However, our structure still takes advantage of the layered pattern such as each layer only having to concern themselves with what is directly next to them in the structure. Making this design decision maintains simplicity throughout development and avoids unnecessary complexity.

UML of Controller

Rationale

We aimed to keep the controller components functionality to a minimum. The controller is primarily responsible for creating new month files, reading external data (such as bank statements), and producing reporting using the analysis class.

GUI mockups of View

Quick GUI Mockups

Welcome

Import Statement Add New Transaction
Modify Transaction Create Budget
View Graphs View Reports

Create New Transaction/Modify Existing Transaction

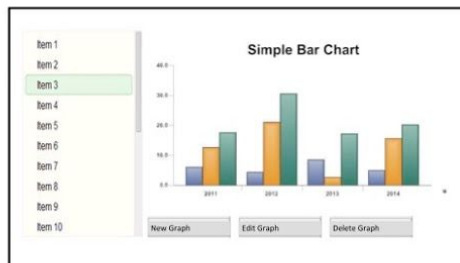

Value:

Transaction Category:

Transaction Type:

Date:

OK Cancel

Create New Graph/Modify Existing Graph

Graph Title:

Categories to Graph:

Start Month:

End Month:

Graph Type:

OK Cancel

Rationale

While we have created a handful of GUI mockup slides, we have decided that it is too early to specify our view component in more detail. We will reevaluate the structure once we have further explored the various GUI libraries available to us.
